Title: EXAMPLE OF THESIS TEMPLATE FOR ITHESIS SYSTEM
Author: Student3 iThesis3, Dissertation: M.S., iThesis Cloud (Demo), 2015
Advisor: Assistant Professor TestAd11 system11, Dr.Ing. Co-advisor: TestAd12 system12, Ph.D. , Professor TestAd13 system13, Ph.D.
Keywords: perch frame, tilapia, antioxidant, hydrolysate

ABSTRACT

The optimum condition to produce protein hydrolysate from tilapia and perch frame with antioxidant (analyzed by DPPH method, metal chelating activity method and TBA assay) and ACE inhibitory properties were investigated. Minced fish frame was enzymatically hydrolyzed by using Flavourzyme 1000 L at different concentration (0, 1, 2 and 3 % w/w) and hydrolysis time (0, 1, 2 and 3 hrs). The results showed that enzyme concentration and hydrolysis time affected the % DPPH radical scavenging, % metal chelating activity, % TBA activity ratio and % ACE inhibition significantly ($P \leq 0.05$). Tilapia frame protein hydrolysate obtained by using 2 % Flavourzyme 1000 L hydrolyzed for 1 hour and perch frame protein hydrolysate obtained by using 3 % Flavourzyme 1000 L for 2 hours were the selected conditions due to the high value of % DPPH radical scavenging, % metal chelating activity, % TBA activity ratio and % ACE inhibition which were 90.38, 91.80, 70.54 and 81.90% for the selected tilapia frame protein hydrolysate, respectively. And % DPPH radical scavenging, % metal chelating activity, % TBA activity ratio and % ACE inhibition were 96.80, 92.54, 90.12 and 92.59 % for the selected perch frame protein hydrolysate, respectively. Spray-dried of the selected protein hydrolysates from tilapia and perch frame were made.

ACKNOWLEDGEMENTS

This research has been successful. Because of the great merit of Asst. Prof. TestAd system, the research consultant, please advise, consult and correct any deficiencies with great care. The researcher is aware of the dedication and devotion of the teachers and highly thanks for this.
